New UV Set Ups for PRi Pro Lite

With UV primers becoming every more present within bodyshops we are pleased to introduce the new UV set ups for the PRi Pro Lite. We have developed two new fluid tips, the UV1 and UV2 along with a dedicated fluid needle to assist with the sensitive application of Refinish UV primers where film build can be very critical to the success of the curing process.

The new UV1 and UV2 fluid tips and needle control the correct fluid delivery required for UV primers ensuring perfect, first time results.

The standard PR10 air cap for the PRi Pro Lite remains unchanged however we have also introduced a new, black polyester cup specifically for the UV materials.
